

# Northeast transect

# Northeast transect

- No Coconino ejecta or lechatelierite were observed in this drill hole.
- This transect best represents an inverted stratigraphic ejecta blanket that was first described by Shoemaker and Kieffer, 1974 and Roddy et al 1978.
- There is some mixing between Kaibab and Moenkopi (average thickness of 1.7 m) at the contact between these two ejecta units.
